Sample Questions and Detailed Explanations

Question 1: Designing an Experiment to Determine the Rate of Reaction

?Describe how you would investigate the effect of concentration on the rate of the reaction between sodium thiosulphate and hydrochloric acid.?

Expert Breakdown:

- Aim: To determine how varying concentrations of sodium thiosulphate affect reaction rate.
- Variables:
 - Independent: Concentration of sodium thiosulphate.
 - Dependent: Time taken for the reaction to reach a certain endpoint (e.g., disappearance of a precipitate).
- Controlled: Temperature, concentration of HCl, volume of reactants.
- Procedure:
 - Prepare solutions of sodium thiosulphate at different concentrations.
 - Add a fixed volume of HCl to each.
 - Record the time until the solution turns cloudy.
- Data Analysis:
 - Plot concentration vs. rate (inverse of time).
 - Determine the order with respect to sodium thiosulphate.

Key Point:

Explain how to ensure reproducibility and minimize experimental errors.

Question 2: Interpreting Titration Data

?Given the titration results for an unknown acid with sodium hydroxide, calculate its molarity.?

| Titre (cm³) | 1st Trial | 2nd Trial | 3rd Trial |

|-----|-----|-----|-----|

| Volume of NaOH used | 25.0 | 25.2 | 24.8 |

Solution Approach:

- Calculate the average titre: $(25.0 + 25.2 + 24.8)/3 = 25.0 \text{ cm}^3$.
- Use the molarity of NaOH (say, 0.1 mol/dm^3).
- Determine moles of NaOH:

Moles = Molarity $\times$ Volume (in dm^3)

$= 0.1 \text{ mol/dm}^3 \times 0.025 \text{ dm}^3 = 2.5 \times 10^{-3} \text{ mol}$.

- Assuming a 1:1 reaction, moles of acid = moles of NaOH.
- Calculate molarity of acid:

$M = \text{moles} / \text{volume (dm}^3\text{)}$.

If the volume of acid used was, for example, 10.0 cm^3 (0.010 dm^3):

$M = 2.5 \times 10^{-3} \text{ mol} / 0.010 \text{ dm}^3 = 0.25 \text{ mol/dm}^3$.

Key Topics Emphasized in the 2013 Paper

Exam boards periodically review and update the focus areas of their assessments. The 2013 paper reflects the Edexcel curriculum's emphasis on certain core themes, which remain relevant today.

Atomic Structure and the Periodic Table

This section typically tests students' understanding of atomic models, isotopes, and the arrangement of elements. Questions may require:

- Explaining the structure of an atom
- Describing the properties of elements based on their position
- Calculating atomic numbers and mass numbers

Bonding and Structure

Understanding how atoms bond (ionic, covalent, and metallic) is central. The paper often includes questions on:

- Dot-and-cross diagrams
- Types of bonding and their impact on properties
- Structures of simple molecules and giant lattices
- The relationship between structure and properties like melting point and solubility

Chemical Reactions and Equations

Students are expected to:

- Write balanced equations
- Identify types of reactions (combustion, displacement, acid-base)
- Understand reaction mechanisms and energy changes

Quantitative Chemistry and Calculations

This segment assesses numerical proficiency with:

- Mole calculations
- Concentration and molarity
- Percentage yields and atom economy

Acids, Bases, and Salts

Questions often deal with:

- pH calculations
- Reactions of acids with metals and carbonates
- Preparing salts via different methods

Organic Chemistry

Basic organic chemistry features in questions about:

- Hydrocarbons and functional groups
- Isomerism
- Crude oil processing

Environmental and Industrial Chemistry

This section covers topics like:

- Pollution and environmental impact
- The role of catalysts
- The chemistry of fertilizers and cleaning agents

Sample Question Analysis from the 2013 Paper

To understand the exam's style and expectations, examining representative questions provides insight into effective approaches.

Example 1: Atomic Structure

Question:

"Describe the structure of an atom of carbon-12 and explain how isotopes of an element differ."

Expected Response:

A carbon-12 atom consists of 6 protons, 6 neutrons, and 6 electrons. The protons and neutrons are located in the nucleus, while electrons orbit around in shells. Isotopes of an element have the same number of protons but differ in the number of neutrons, leading to different mass numbers but similar chemical properties.

Example 2: Bonding and Properties

Question:

"Explain why sodium chloride has a high melting point."

Expected Response:

Sodium chloride has a giant ionic lattice structure, where each sodium ion is surrounded by chloride ions and vice versa. The electrostatic attraction between oppositely charged ions is strong, requiring a large amount of energy to break the bonds, resulting in a high melting point.

Example 3: Quantitative Calculations

Question:

"If 5 grams of calcium carbonate react completely with hydrochloric acid, how many moles of calcium carbonate are used? (Atomic masses: Ca = 40, C = 12, O = 16)

Solution:

Molecular mass of $\text{CaCO}_3 = 40 + 12 + (16 \times 3) = 100 \text{ g/mol}$

Number of moles = mass / molar mass = $5 / 100 = 0.05 \text{ mol}$
