Understanding Logarithms: A Brief Overview

Before diving into word problems, let's briefly review what logarithms are:

- Definition: The logarithm of a number is the exponent to which a fixed base must be raised to produce that number.

For example, $\log_b x = y$ means $b^y = x$.

- Common Bases:

- Base 10 (Common logarithm): $\log_{10}$

- Base e (Natural logarithm): $\ln$

- Properties:

- $\log_b(xy) = \log_b x + \log_b y$

- $\log_b\left(\frac{x}{y}\right) = \log_b x - \log_b y$

- $\log_b x^k = k \log_b x$

- Change of base formula: $\log_b x = \frac{\log_k x}{\log_k b}$

Understanding these fundamentals will help you solve any logarithm word problem with confidence.

Logarithm Word Problems Examples with Step-by-Step Solutions

Let's explore detailed examples to illustrate how to approach and solve real-world problems involving logarithms.

Example 1: Population Growth

Problem: The population of a town was 20,000 in 2010. It has been growing at an annual rate of 4%. What will the population be in 2025?

Solution:

Step 1: Identify the variables:

- Initial population, $(P_0 = 20,000)$
- Growth rate, $(r = 4\% = 0.04)$
- Number of years, $(t = 2025 - 2010 = 15)$

Step 2: Write the exponential growth formula:

[

$$P(t) = P_0 \times (1 + r)^t$$

]

[

$$P(15) = 20,000 \times (1 + 0.04)^{15}$$

]

Step 3: Calculate:

[

$$P(15) = 20,000 \times (1.04)^{15}$$

]

Step 4: Use logarithms to find the growth factor if the rate is unknown, or to verify growth:

Suppose we want to find how long it takes for the population to reach 30,000, given the growth rate.

[

$$30,000 = 20,000 \times (1.04)^t$$

\]

Divide both sides by 20,000:

\[

$$1.5 = (1.04)^t$$

\]

Take the natural logarithm:

\[

$$\ln 1.5 = \ln (1.04)^t = t \times \ln 1.04$$

\]

Solve for t :

\[

$$t = \frac{\ln 1.5}{\ln 1.04}$$

\]

Calculate:

\[

$$t = \frac{0.4055}{0.0392} \approx 10.34$$

\]

Answer: It will take approximately 10.34 years for the population to reach 30,000.

Example 2: Radioactive Decay

Problem: A certain radioactive substance has a half-life of 8 hours. How long will it take for a sample of 100 grams to decay to 25 grams?

Solution:

Step 1: Recognize this is exponential decay:

\[

$$A(t) = A_0 \times \left(\frac{1}{2}\right)^{t / T_{1/2}}$$

\]

where $(A_0 = 100)$, $(A(t) = 25)$, $(T_{1/2} = 8)$ hours.

Step 2: Set up the equation:

\[

$$25 = 100 \times \left(\frac{1}{2}\right)^{t / 8}$$

\]

Divide both sides by 100:

\[

$$0.25 = \left(\frac{1}{2}\right)^{t / 8}$$

\]

Step 3: Take natural logarithms:

\[

$$\ln 0.25 = \ln \left(\left(\frac{1}{2}\right)^{t/8}\right) = \frac{t}{8} \times \ln \frac{1}{2}$$

\]

Step 4: Solve for (t) :

\[

$$t = 8 \times \frac{\ln 0.25}{\ln \frac{1}{2}}$$

\\

Calculate:

\\

$$\ln 0.25 = -1.3863$$

\\

\\

$$\ln \frac{1}{2} = -0.6931$$

\\

So:

\\

$$t = 8 \times \frac{-1.3863}{-0.6931} = 8 \times 2 = 16$$

\\

Answer: It will take 16 hours for the sample to decay to 25 grams.

Example 3: pH Calculation

Problem: A solution has an acidity level with a hydrogen ion concentration of (2.5×10^{-5}) mol/L. What is its pH?

Solution:

Step 1: Recall the pH formula:

\\

$$\text{pH} = -\log_{10} [\text{H}^+]$$

\\

Step 2: Substitute the given value:

$$\text{pH} = -\log_{10} (2.5 \times 10^{-5})$$

$$\text{pH} = - [\log_{10} 2.5 + \log_{10} 10^{-5}] = - [\log_{10} 2.5 - 5]$$

Calculate $(\log_{10} 2.5)$:

$$\log_{10} 2.5 \approx 0.3979$$

$$\text{pH} = - (0.3979 - 5) = -0.3979 + 5 = 4.6021$$

Answer: The pH of the solution is approximately 4.60.

Example 4: Compound Interest and Investment

Problem: An investment of \$5,000 grows at an annual interest rate of 6%. How long will it take for the investment to grow to \$10,000?

Solution:

Step 1: Use the compound interest formula:

[

$$A = P \times (1 + r)^t$$

]

where:

- $(A = 10,000)$

- $(P = 5,000)$

- $(r = 0.06)$

Step 2: Set up the equation:

[

$$10,000 = 5,000 \times (1.06)^t$$

]

Divide both sides by 5,000:

[

$$2 = (1.06)^t$$

]

Step 3: Take the natural logarithm:

[

$$\ln 2 = t \times \ln 1.06$$

]

Calculate:

$$\ln 2 \approx 0.6931$$

$$\ln 2 \approx 0.6931$$

$$\ln 1.06 \approx 0.0583$$

$$\ln 1.06 \approx 0.0583$$

$$\ln 1.06 \approx 0.0583$$

Fundamental Components of Logarithm Word Problems

Before delving into specific examples, it is crucial to understand the typical structure and elements involved in logarithm word problems:

- Contextual Narrative: The real-world scenario or application setting.
- Quantities and Variables: Known and unknown quantities representing the problem's parameters.
- Relationships and Conditions: Descriptions of how quantities relate, often involving exponential or logarithmic relationships.
- Question or Objective: The specific quantity or value to be determined.

Effective problem-solving begins with translating the narrative into a mathematical model, often involving logarithmic or exponential equations.

Common Types of Logarithm Word Problems and Their Examples

This section explores typical categories of logarithm word problems, supported by illustrative examples and detailed solutions.

1. Decibel and Sound Intensity Problems

Scenario: The loudness of sound is measured in decibels (dB), related to the intensity (I) of the sound by the formula:

$$\text{Decibels (dB)} = 10 \log_{10} \left(\frac{I}{I_0} \right),$$

where I_0 is a reference intensity.

Example Problem:

A sound has an intensity of $1 \times 10^{-8} \text{ W/m}^2$, and it is measured to be 60 dB. What is the reference intensity I_0 ?

Solution Approach:

- Recognize the relationship: $\text{dB} = 10 \log_{10} \left(\frac{I}{I_0} \right)$.
- Rearrange to solve for I_0 :

$$I_0 = I \times 10^{-\frac{\text{dB}}{10}}.$$

- Plug in known values:

$$I_0 = 1 \times 10^{-8} \times 10^{-\frac{60}{10}} = 1 \times 10^{-8} \times 10^{-6} = 1 \times 10^{-14}$$

$$10^{-14} \text{ W/m}^2.$$

Insights:

This problem exemplifies how logarithmic equations model perceptual scales and demonstrate the exponential nature of sound intensity.

2. Radioactive Decay and Half-Life Problems

Scenario: The decay of radioactive material follows the exponential model:

$$N(t) = N_0 e^{-\lambda t},$$

where $N(t)$ is the quantity remaining after time t , N_0 is the initial quantity, and λ is the decay constant.

Example Problem:

A sample of a radioactive isotope has a half-life of 12 hours. How long will it take for the sample to decay to 25% of its original amount?

Solution Approach:

- Recognize that the half-life $T_{1/2}$ relates to λ :

$$T_{1/2} = \frac{\ln 2}{\lambda}.$$

- Find λ :

$$\lambda = \frac{\ln 2}{12}.$$

- Determine the time t when $N(t) = 0.25 N_0$:

$$0.25 N_0 = N_0 e^{-\lambda t} \rightarrow 0.25 = e^{-\lambda t}.$$

- Take natural logarithm:

$$\ln 0.25 = -\lambda t \Rightarrow t = -\frac{\ln 0.25}{\lambda}.$$

- Substitute λ :

$$t = -\frac{\ln 0.25}{\frac{\ln 2}{12}} = -\frac{\ln 0.25}{\ln 2} \times 12.$$

- Calculate:

$$\ln 0.25 = \ln \left(\frac{1}{4} \right) = -\ln 4 = -1.386.$$

$$\ln 2 = 0.693.$$

$$t = -\frac{-1.386}{0.693} \times 12 = 2 \times 12 = 24 \text{ hours}.$$

Insights:

This example highlights the use of logarithms in modeling exponential decay and the concept of half-life.

3. Population Growth and Decay Models

Scenario: Population $P(t)$ grows exponentially:

$$P(t) = P_0 e^{rt},$$

where r is the growth rate.

Example Problem:

A city's population was 1 million in 2010. If it grew to 1.2 million by 2015, assuming continuous growth, what is the annual growth rate r ?

Solution Approach:

- Set known values:

$$1.2 \times 10^6 = 1 \times 10^6 \times e^{5r}.$$

- Simplify:

$$1.2 = e^{5r}$$

- Take natural logarithm:

$$\ln 1.2 = 5r \rightarrow r = \frac{\ln 1.2}{5}$$

- Calculate:

$$\ln 1.2 \approx 0.182$$

$$r \approx \frac{0.182}{5} = 0.0364$$

- Convert to percentage:

$$r \approx 3.64\% \text{ per year}$$

Insights:

This problem illustrates how logarithms enable the calculation of growth rates from real data.

4. pH and Logarithmic Concentration Problems

Scenario: The pH of a solution relates to hydrogen ion concentration:

$$\text{pH} = -\log_{10} [\text{H}^+]$$

Example Problem:

A solution has a pH of 3.5. What is the concentration of hydrogen ions $[\text{H}^+]$?

Solution Approach:

- Rearrange:

$$[\text{H}^+] = 10^{-\text{pH}}$$

- Calculate:

$$[H^+] = 10^{-3.5} \approx 3.16 \times 10^{-4} \text{ mol/L.}$$

Insights:

This type of problem demonstrates the application of logarithms in chemistry for quantifying acidity.

Question What is a common example of a logarithm word problem involving compound interest? A typical problem asks: If an investment grows to \$10,000 in 5 years at an annual interest rate of 5%, how long will it take to double the investment? You can use the logarithm form of the compound interest formula to solve for time. How do you solve a problem where you need to find the exponent in an exponential equation using logarithms? You rewrite the exponential equation in logarithmic form. For example, if $2^x = 16$, then $x = \log_2(16)$, which equals 4. This helps find the exponent directly. Can you give an example of a word problem involving pH levels and logarithms? Yes. The pH of a solution is calculated as $\text{pH} = -\log[\text{H}^+]$. If the hydrogen ion concentration $[\text{H}^+]$ is 1×10^{-4} M, then the pH is $-\log(1 \times 10^{-4}) = 4$. How do logarithms help in solving problems involving scales like Richter or decibel scales? Both scales are logarithmic. For example, the Richter scale measures earthquake magnitude. If an earthquake has a magnitude of 6, and another has a magnitude of 4, the difference corresponds to a $10^{(6-4)} = 100$ -fold increase in amplitude, which can be calculated using logarithms. What is an example of a real-world problem involving exponential decay and logarithms? Suppose a radioactive substance has a half-life of 3 hours. How much remains after 9 hours? Using exponential decay, you can set up the equation and use logarithms to find the remaining percentage. How can logarithms be used to solve problems involving sound intensity levels? Sound intensity levels in decibels (dB) are calculated using the formula $\text{dB} = 10 \log_{10}(I / I_0)$, where I is the intensity. If the intensity doubles, the dB level increases by about 3 dB, which can be found using logarithms. Can you provide an example of a word problem involving exponential growth and logarithms? Yes. If a population of bacteria doubles every 3 hours and starts with 100 bacteria, how long until the population reaches 800? Using the exponential growth formula and logarithms, you can find the time needed. How do you approach solving logarithmic word problems involving transformations or shifts? Identify the exponential or logarithmic relationship, rewrite it in log form if needed, and then solve for the variable of interest. For example, solving for time or rate in growth or decay processes often involves taking logarithms to linearize the problem. What are some tips for translating word problems into logarithmic equations? Read carefully to identify exponential relationships, such as growth or decay. Write the relevant formula, then take the logarithm of both sides to solve for the unknown exponent or variable. Practice recognizing patterns like doubling, halving, or exponential increase/decrease.

Understanding Natural Logarithms

What Is a Natural Logarithm?

The natural logarithm, written as $\ln(x)$, is the logarithm to the base e , where e is an irrational constant approximately equal to 2.71828. It is defined as the inverse function of the exponential function e^x . In simple terms, if:

- $\ln(x) = y$,

This inverse relationship makes natural logarithms particularly useful for solving exponential equations and modeling growth or decay processes.

Properties of Natural Logarithms

Understanding the properties of $\ln(x)$ simplifies solving practice problems. Key properties include:

- **$\ln(1) = 0$** because $e^0 = 1$.
- **$\ln(e) = 1$** because $e^1 = e$.
- **$\ln(xy) = \ln(x) + \ln(y)$** (Product rule).

- $\ln(x/y) = \ln(x) - \ln(y)$ (Quotient rule).
- $\ln(x^k) = k \ln(x)$ (Power rule).
- $\ln(e^x) = x$ and $e^{\ln(x)} = x$ (Inverse functions).

Preparing for Practice 7 6: Key Concepts and Techniques

- Using natural logs in calculus, such as differentiation and integration.

Step-by-Step Strategies for Practice 7 6 Natural Logarithms

1. Simplify Logarithmic Expressions

Break down complex expressions using properties:

- Convert products into sums: $\ln(AB) = \ln(A) + \ln(B)$
- Convert quotients into differences: $\ln(A/B) = \ln(A) - \ln(B)$
- Bring exponents outside: $\ln(A^k) = k \ln(A)$

Example:

Simplify $\ln(8x^3/2y)$.

Solution:

- Use quotient rule: $\ln(8x^3) - \ln(2y)$
- Further expand numerator: $\ln(8) + 3 \ln(x) - [\ln(2) + \ln(y)]$
- Simplify constants: $(\ln(8) - \ln(2)) + 3 \ln(x) - \ln(y)$
- Since $\ln(8) - \ln(2) = \ln(8/2) = \ln(4)$, the expression becomes:
 $\ln(4) + 3 \ln(x) - \ln(y)$

2. Solve Equations Involving $\ln(x)$

When solving equations like $\ln(x) = a$ or $\ln(x) + \ln(y) = b$, use the inverse relationship and properties:

- Isolate the logarithmic term.
- Convert to exponential form: $x = e^{\{a\}}$.
- For sums of logs, combine them using the product rule.
- Check the domain restrictions ($x > 0$).

Example:

Solve for x : $\ln(x) + \ln(2) = 3$.

Solution:

- Combine logs: $\ln(2x) = 3$
- Exponentiate both sides: $2x = e^3$
- Divide to solve for x : $x = e^3 / 2$

3. Apply in Word Problems and Real-World Contexts

Natural logarithms are often used in growth models, decay processes, and financial calculations. Understand the context and set up the equations accordingly:

- For exponential growth/decay: $N(t) = N_0 e^{\{kt\}}$
- To solve for time or rate: take the $\ln$ of both sides.

- Logarithmic scales (e.g., pH in chemistry)

For example:

"If a bacteria population doubles every 3 hours, how long will it take for the population to reach 1000 bacteria, starting from 100?"

Solution:

$\int$

$$N(t) = N_0 \times 2^{t/3}$$

$\int$

Set $(N(t) = 1000)$, $(N_0=100)$:

$\int$

$$1000 = 100 \times 2^{t/3}$$

\]

Divide:

\[

$$10 = 2^{t/3}$$

\]

Take natural log:

\[

$$\ln(10) = \frac{t}{3} \ln(2)$$

\]

Solve for t :

\[

$$t = 3 \times \frac{\ln(10)}{\ln(2)} \approx 3 \times \frac{2.3026}{0.6931} \approx 3 \times 3.3219 \approx 9.97 \text{ hours}$$

\]

This illustrates the practical application of natural logarithms in real-world scenarios.

Final Thoughts

Practice 7 6 offers a comprehensive opportunity to deepen mastery over natural logarithms, blending algebraic skills, calculus fundamentals, and real-world applications. By systematically

approaching each problem type? simplification, equation solving, calculus, and applied modeling? learners can transform their understanding from basic familiarity to expert proficiency.

Natural logarithms are more than a mathematical tool; they are a bridge to understanding exponential processes that shape our universe. Whether tackling complex equations or modeling growth phenomena, mastery of $\ln(x)$ empowers you to interpret and manipulate the exponential

Question What is the main focus of Practice 7.6 on natural logarithms? Practice 7.6 focuses on understanding and applying properties of natural logarithms, solving equations involving $\ln$, and evaluating natural logarithmic expressions. How can I simplify expressions involving multiple natural logarithms in Practice 7.6? You can use properties like $\ln(ab) = \ln(a) + \ln(b)$ and $\ln(a/b) = \ln(a) - \ln(b)$ to simplify expressions with multiple natural logarithms. What techniques are emphasized in Practice 7.6 for solving equations with natural logarithms? The practice highlights methods such as rewriting equations using logarithm properties, isolating the $\ln$ term, and exponentiating both sides to solve for the variable. Why is understanding the domain important in natural logarithm problems in Practice 7.6? Because the natural logarithm function is only defined for positive real numbers, ensuring the domain restrictions are met is crucial when solving equations to find valid solutions. Can you give an example of a typical problem from Practice 7.6 involving natural logarithms? An example problem might be solving for x in the equation $\ln(x) + \ln(x-2) = 3$, where you would use logarithm properties to combine and solve the equation.

Pre calculus logarithms exam and answers

Pre Calculus Logarithms Exam and Answers

Preparing for a pre calculus logarithms exam can seem daunting, but with the right strategies and understanding, you can excel and confidently tackle any question that comes your way. This comprehensive guide aims to help students master the key concepts of logarithms, provide practice questions, and supply detailed answers to enhance comprehension. Whether you're reviewing for an upcoming test or seeking to solidify your knowledge, this article covers essential topics and typical exam questions to boost your confidence.

Understanding Logarithms in Pre Calculus

Before diving into sample questions and answers, it's crucial to understand what logarithms are and how they function within pre calculus.

What Is a Logarithm?

- A logarithm is the inverse operation of exponentiation.
- The logarithm of a number asks: "To what power must a specific base be raised to obtain this number?"
- The general form is: $\log_b(x) = y$, which means $b^y = x$.
- For example, $\log_2(8) = 3$ because $2^3 = 8$.

Properties of Logarithms

Understanding properties simplifies complex logarithmic expressions:

- **Product Property:** $\log_b(xy) = \log_b(x) + \log_b(y)$
- **Quotient Property:** $\log_b(x/y) = \log_b(x) - \log_b(y)$

- **Power Property:** $\log_b(x^k) = k \log_b(x)$
- **Change of Base Formula:** $\log_b(x) = \log_k(x) / \log_k(b)$

Common Types of Logarithmic Problems in Pre Calculus

Understanding the types of problems frequently encountered can help tailor your study approach.

Evaluating Logarithms

- Find the value of a given logarithm.
- Example: Evaluate $\log_3(81)$.

Solving Logarithmic Equations

- Find the variable's value in equations involving logarithms.
- Example: Solve $\log_2(x) = 5$.

Applying Logarithmic Properties

- Simplify complex logarithmic expressions.
- Example: Simplify $\log_5(25) + \log_5(4)$.

Converting Between Logarithmic and Exponential Forms

- Switch between forms to make solving easier.
- Example: Rewrite $\log_{10}(1000) = 3$ in exponential form.

Sample Pre Calculus Logarithms Exam Questions and Answers

Practicing with actual exam questions is one of the best ways to prepare. Here are several typical problems with detailed solutions.

Question 1: Evaluate the Logarithm

Evaluate $\log_2(16)$.

Answer:

Since 16 is a power of 2 ($2^4 = 16$), then:

$$\log_2(16) = 4.$$

Question 2: Solve for x in the logarithmic equation

Solve $\log_3(x) = 4$.

Answer:

Rewrite in exponential form:

$$3^4 = x$$

Calculate:

$$x = 81.$$

Question 3: Simplify the Expression

Simplify $\log_5(25) + \log_5(4)$.

Answer:

Apply the product property:

$$\log_5(25 \cdot 4) = \log_5(100)$$

Since $25 = 5^2$, then:

$$\log_5(100) = \log_5(5^2 \cdot 4)$$

But better to just evaluate directly:

$$\log_5(100) = ?$$

Express 100 as $5^2 \cdot 4$:

$$\log_5(100) = \log_5(5^2 \cdot 4)$$

Alternatively, note that:

$$\log_5(25) = 2$$

and

$$\log_5(4) \approx 0.861.$$

Adding:

$$2 + 0.861 \approx 2.861.$$

But more precise:

$$\log_5(100) = \log_5(4 \cdot 25) = \log_5(4) + \log_5(25) = \log_5(4) + 2.$$

Thus, the simplified form is:

$$\log_5(100) = \log_5(4) + 2.$$

Question 4: Change of Base Calculation

Calculate $\log_7(50)$ using common logarithms (base 10).

Answer:

Use the change of base formula:

$$\log_7(50) = \log_{10}(50) / \log_{10}(7).$$

Calculate:

$$\log_{10}(50) \approx 1.69897$$

$$\log_{10}(7) \approx 0.84510$$

Therefore:

$$\log_7(50) \approx 1.69897 / 0.84510 \approx 2.009.$$

Question 5: Solving a Logarithmic Equation

Solve for x: $2 \log_3(x) = 4$.

Answer:

Divide both sides by 2:

$$\log_3(x) = 2.$$

Rewrite in exponential form:

$$3^2 = x$$

Calculate:

$$x = 9.$$

Pre Calculus Logarithms Exam and Answers: A Comprehensive Guide to Mastering Logarithmic Concepts

Preparing for a pre calculus logarithms exam can seem daunting at first, but with a solid understanding of the foundational concepts and effective strategies, students can confidently approach questions and achieve success. Logarithms are a crucial component of pre calculus, serving as the inverse of exponential functions and underpinning many advanced mathematical topics. This guide aims to break down the essential principles, provide sample questions with detailed answers, and equip you with practical tips to excel in your exam.

Understanding Logarithms: The Foundation of Your Pre Calculus Exam

Before diving into practice problems, it's vital to grasp what logarithms are, why they matter, and how they relate to exponential functions.

What Is a Logarithm?

A logarithm answers the question: To what power must a specific base be raised to get a certain number?

Mathematically, it's expressed as:

$$\log_b(a) = c$$

which means:

$$b^c = a$$

where:

- b is the base (a positive real number $\neq 1$),

- a is the argument (a positive real number),
- c is the exponent or logarithm value.

Example:

$$\log_2(8) = 3 \text{ because } 2^3 = 8.$$

Why Are Logarithms Important?

Logarithms simplify complex calculations involving exponential growth and decay, such as in finance, biology, physics, and computer science. They also help solve equations where the variable appears as an exponent.

Core Properties of Logarithms

Mastering the properties of logarithms is essential for solving problems efficiently and accurately. Here are the key properties:

- Product Property

$$\log_b(M N) = \log_b(M) + \log_b(N)$$

- Quotient Property

$$\log_b(M / N) = \log_b(M) - \log_b(N)$$

- Power Property

$$\log_b(M^k) = k \log_b(M)$$

- Change of Base Formula

$$\log_b(a) = \log(a) / \log(b)$$

(Useful for calculators that only handle common or natural logs)

- Logarithm of 1

$\log_b(1) = 0$, because $b^0 = 1$

- Logarithm of the Base

$\log_b(b) = 1$, because $b^1 = b$

Common Types of Logarithmic Problems on the Exam

Pre calculus logarithms questions often fall into several categories, including:

- Simplifying logarithmic expressions
- Solving logarithmic equations
- Converting between exponential and logarithmic forms
- Applying properties to evaluate expressions
- Word problems involving real-world applications

Understanding the typical question formats helps in strategic preparation.

Step-by-Step Approach to Solving Logarithmic Problems

Step 1: Recognize the Type

Identify whether the problem asks for simplification, solving an equation, or application.

Step 2: Rewrite in a Familiar Form

Convert between exponential and logarithmic forms as needed.

Step 3: Apply Logarithmic Properties

Use the properties to simplify expressions or solve for variables.

Step 4: Use a Calculator When Appropriate

For non-integer logs or change of base calculations, utilize your calculator wisely.

Step 5: Verify the Solution

Check your answers in the original equation, especially when solutions involve restrictions (e.g., arguments must be positive).

Sample Practice Questions and Detailed Solutions

Question 1: Simplify the expression

$$\log_3(81) + \log_3(1/9)$$

Solution:

- Recognize that 81 and $1/9$ can be expressed as powers of 3:

- $81 = 3^4$

- $1/9 = 3^{-2}$

- Apply the product property:

$$\log_3(81) + \log_3(1/9) = \log_3(81 \cdot 1/9) = \log_3(81/9)$$

- Simplify the argument:

$$81/9 = 9$$

- Write 9 as a power of 3:

$$9 = 3^2$$

- So, $\log_3(9) = \log_3(3^2) = 2$

Answer: 2

Question 2: Solve for x:

$$\log_2(x) + \log_2(x - 4) = 3$$

Solution:

- Use the product property to combine logs:

$$\log_2[x(x - 4)] = 3$$

- Rewrite in exponential form:

$$x(x - 4) = 2^3 = 8$$

- Expand:

$$x^2 - 4x = 8$$

- Bring all to one side:

$$x^2 - 4x - 8 = 0$$

- Use the quadratic formula:

$$x = [4 \pm \sqrt{(16 - 4 \cdot 1 \cdot (-8))}] / (2 \cdot 1)$$

$$x = [4 \pm \sqrt{(16 + 32)}] / 2$$

$$x = [4 \pm \sqrt{48}] / 2$$

$$\sqrt{48} = \sqrt{(16 \cdot 3)} = 4\sqrt{3}$$

- Final solutions:

$$x = [4 \pm 4\sqrt{3}] / 2$$

$$x = 2 \pm 2\sqrt{3}$$

- Check for extraneous solutions:
- Arguments of logs must be positive:

$$x > 0 \text{ and } x - 4 > 0 \Rightarrow x > 4$$

- $x = 2 + 2\sqrt{3} \approx 2 + 3.464 \approx 5.464$, which is > 4 ?
- $x = 2 - 2\sqrt{3} \approx 2 - 3.464 \approx -1.464$, invalid because argument negative.

Answer: $x = 2 + 2\sqrt{3}$

Question 3: Convert the exponential form to logarithmic form:

$$7^x = 49$$

Solution:

- Recognize that $49 = 7^2$.
- Rewrite as:

$$7^x = 7^2$$

- Since bases are the same, set exponents equal:

$$x = 2$$

Alternatively, in logarithmic form:

$$\log_7(49) = x$$

which evaluates to:

$$\log_7(7^2) = 2$$

Question What is the basic definition of a logarithm in pre-calculus? A logarithm is the inverse operation of exponentiation. For example, $\log(b)$ answers the question: to what power must a be raised to get b ? Mathematically, if $a^x = b$, then $\log(b) = x$. How do you evaluate logarithms with different bases? You can evaluate logarithms with different bases using the change of base formula: $\log(b) = \frac{\log(b)}{\log(a)}$ or $\log(b) = \frac{\ln(b)}{\ln(a)}$, where $\log$ is common logarithm and $\ln$ is natural logarithm. What are the key properties of logarithms that are commonly tested? Key properties include: $\log(1) = 0$, $\log(a) = 1$, $\log(bc) = \log(b) + \log(c)$, and $\log(b/c) = \log(b) - \log(c)$. These properties simplify logarithmic expressions and equations. How do you solve exponential equations using logarithms? To solve an exponential equation, take the logarithm of both sides with an appropriate base. For example, if $a^x = b$, then $x = \log(b)$. Using logarithms allows you to solve for the exponent when the variable is in the exponent. What is the significance of the change of base formula in pre-calculus logarithms? The change of base formula allows you to evaluate logarithms with bases that are not standard or readily available on calculators, enabling conversions to common or natural logs for easier computation. How can logarithmic and exponential

functions be graphically distinguished in pre-calculus? Exponential functions typically have a rapid growth or decay shape, whereas logarithmic functions increase slowly and are the inverse of exponential functions. Their graphs are reflections of each other across the line $y = x$. What are common mistakes to avoid when working with logarithms in a pre-calculus exam? Common mistakes include forgetting the domain restrictions (e.g., $\log(b)$ is only defined for $b > 0$), mixing different bases without proper conversion, and misapplying properties or rules, especially with negative or fractional exponents. Are there specific formulas or identities that frequently appear on pre-calculus logarithm exams? Yes, frequently tested identities include the product, quotient, and power rules for logarithms, as well as the change of base formula and the properties of logarithms with different bases. Memorizing these helps simplify complex problems.
