- Validation & Verification: Extensive libraries and validation cases for automotive applications.

Step-by-Step Approach to Windshield Impact Analysis Using ANSYS

Conducting a windshield impact analysis involves a series of meticulously planned steps. Each phase ensures that the simulation results are reliable and actionable.

1. Problem Definition and Objective Setting

Before beginning, clearly define the scope of the study:

- Impact type (e.g., stone chip, pedestrian collision, rollover).
- Impact velocity and angle.
- Material properties and structural constraints.
- Expected failure modes (fracture, delamination, dislodgement).

This foundational step guides the entire modeling process.

2. Geometric Modeling

Create a detailed 3D model of the windshield assembly:

- Geometry Creation: Use CAD tools (e.g., ANSYS DesignModeler, SolidWorks) to develop accurate geometries, including glass, adhesive layers, and framing.
- Simplification: Remove unnecessary details that do not influence impact behavior to optimize computational efficiency.
- Mesh Generation: Generate a high-quality finite element mesh. Use finer elements in regions of expected high stress concentration, such as edges and impact zones.

3. Material Property Assignment

Accurate material modeling is crucial. For windshields:

- Glass: Typically modeled as brittle, with properties such as Young's modulus (~70 GPa), Poisson's ratio (~0.22), density (~2,500 kg/m³), and fracture criteria.
- Adhesives & Laminates: Use polymer models with elastic-plastic behavior.
- Support Structures: Define their stiffness and damping characteristics.

In ANSYS, material models can be customized to include damage and fracture properties, such as cohesive zone modeling for crack propagation.

4. Boundary Conditions and Constraints

Apply realistic boundary conditions to mimic actual vehicle mounting:

- Fixation points representing the frame attachment.
- Contact definitions between glass and supports or other components.
- Symmetry conditions if applicable to reduce model size.

5. Impactor and Loading Definition

Model the impacting object:

- Impact Object: Usually a projectile (e.g., stone, metal ball).
- Material: Steel, rubber, or other relevant materials.
- Velocity & Angle: Based on real-world data or standard testing protocols.
- Initial Position and Motion: Set initial conditions for the impact event.

Use ANSYS's transient dynamics capabilities to simulate the impact over time.

6. Simulation Setup

Configure the analysis:

- Select appropriate solvers (explicit for high-speed impacts).
- Define time steps to capture transient effects accurately.
- Enable fracture and damage models if crack initiation and propagation are to be studied.
- Incorporate damping and contact algorithms for realistic interactions.

7. Running the Simulation

Execute the impact analysis. Depending on model complexity, this could take from minutes to several hours. Monitor key parameters such as energy absorption, stress, strain, and displacement during the simulation.

8. Post-Processing and Results Interpretation

Analyze the simulation output:

- Stress & Strain Distribution: Identify regions of high stress concentrations.
- Deformation & Displacement: Assess if the windshield maintains integrity or cracks.
