"Polymorphism is a core principle of object-oriented programming that allows objects of different classes to be treated as instances of a common superclass. It enables methods to be overridden in derived classes, so the appropriate method is invoked based on the object's actual class at runtime. This promotes flexibility and code reusability. For example, if we have a superclass 'Shape' with a method 'draw()', subclasses like 'Circle' and 'Rectangle' can override 'draw()' to implement specific behaviors, and the correct method executes depending on the object instance."

Expert Tip: Use the STAR method (Situation, Task, Action, Result) to structure your responses effectively.

Example 2: Handling Pressure

Question: "Describe a situation where you had to meet a tight deadline. How did you manage?"
