Understanding Electric Power: The Foundation

Before diving into answer keys and problem-solving strategies, it's crucial to understand what electric power entails and the fundamental formulas involved.

What Is Electric Power?

Electric power, measured in watts (W), refers to the rate at which electrical energy is transferred or converted into other forms of energy such as heat, light, or mechanical work. It indicates how quickly work is being done by an electrical circuit.

Basic Formula for Electric Power

The core formula connecting voltage, current, and power is:

$$P = V \times I$$

where:

- P is power in watts (W)
- V is voltage in volts (V)
- I is current in amperes (A)

This formula is the foundation for most calculations involving power in direct current (DC) circuits.

Additional Formulas Derived from Ohm's Law

Ohm's Law states:

$$V = I \times R$$

where R is resistance in ohms (Ω).

Using Ohm's Law, power can also be expressed as:

- $P = I^2 \times R$
- $P = V^2 / R$

These alternative formulas are useful when either voltage, current, or resistance is known, but not all three.

Common Types of Electric Power Problems and Their Answer Keys

Understanding typical question formats and their solutions is essential for developing problem-solving skills. Below are common problem types, accompanied by detailed answer strategies.

- Calculating Power with Known Voltage and Current

Problem Example:

A circuit has a voltage of 120 V and a current of 3 A. What is the power consumed?

Solution Steps:

- Use the basic formula: $P = V \times I$
- Substitute known values: $P = 120 \text{ V} \times 3 \text{ A}$
- Calculate: $P = 360 \text{ W}$

Answer: 360 watts

- Calculating Power with Resistance and Voltage

Problem Example:

A resistor has a resistance of $10 \text{ } \Omega$ and is connected to a 120 V supply. Find the power dissipation.

Solution Steps:

- Use the formula: $P = V^2 / R$
- Substitute: $P = (120 \text{ V})^2 / 10 \text{ } \Omega$
- Calculate numerator: $120^2 = 14,400$
- Divide: $14,400 / 10 = 1,440 \text{ W}$

Answer: 1,440 watts

- Calculating Power with Resistance and Current

Problem Example:

A circuit has a resistance of $15 \text{ } \Omega$ and passes a current of 2 A. Find the power used.

Solution Steps:

- Use the formula: $P = I^2 \times R$
- Substitute: $P = (2 \text{ A})^2 \times 15 \text{ } \Omega$
- Calculate: $4 \times 15 = 60 \text{ W}$

Answer: 60 watts

- Calculating Unknown Resistance or Voltage

Problem Example:

A device consumes 300 W of power when connected to a 120 V supply. What is its resistance?

Solution Steps:

- Use the formula: $R = V^2 / P$
- Substitute: $R = (120 \text{ V})^2 / 300 \text{ W}$
- Calculate numerator: 14,400
- Divide: $14,400 / 300 = 48 \text{ ?}$

Answer: 48 ohms

Advanced Problems and Critical Thinking

Once familiar with basic formulas, tackling more complex problems enhances understanding and prepares you for real-world applications.

- Power in AC Circuits

While most formulas are straightforward in DC circuits, AC circuits involve additional considerations like power factor (pf).

Problem Example:

An AC circuit has a voltage of 240 V, a current of 10 A, and a power factor of 0.8. Find the real power.

Solution Steps:

- Use the formula: $P = V \times I \times \text{pf}$
- Substitute: $P = 240 \text{ V} \times 10 \text{ A} \times 0.8$
- Calculate: $2,400 \times 0.8 = 1,920 \text{ W}$

Answer: 1,920 watts

- Energy Consumption Over Time

Sometimes, problems involve calculating total energy used over a period.

Problem Example:

A device consumes 100 W and operates for 5 hours daily. What is its total energy consumption in kilowatt-hours (kWh)?

Solution Steps:

- Convert power to kilowatts: $100 \text{ W} = 0.1 \text{ kW}$
- Multiply by hours: $0.1 \text{ kW} \times 5 \text{ hours} = 0.5 \text{ kWh}$

Answer: 0.5 kilowatt-hours

$$\text{Total resistance } R_{\text{total}} = R_1 + R_2 + R_3 = 10\Omega + 20\Omega + 30\Omega = 60\Omega$$

Problem 2: Voltage Drop Calculation

Question: A wire carrying 50A over 100 meters has a resistance of 0.2 Ω per 100 meters. What is the voltage drop?

Solution:

$$\text{Voltage drop } V_{\text{drop}} = I \times R = 50\text{A} \times 0.2\Omega = 10\text{V}$$

Problem 3: Converting Watts to Horsepower

Question: What is 1500 watts expressed in horsepower? (1 horsepower = 745.7 watts)

Solution:

$$\text{Horsepower} = 1500 / 745.7 = 2.01 \text{ HP}$$
